<h2>Introduction</h2>
Quantum Views is Quantum's venue for perspectives, views, editorials
and other opinion pieces. The publishing process is different from
that of regular articles in Quantum because Views are published as
HTML only, and need not be uploaded to the arXiv.
   Quantum provides the quantumview documentclass to enable authors
of Views to use their common LaTeX environment to prepare their contributions.
The editors at Quantum can then generate the HTML output by supplying
the <tt>html</tt> option.
<h2>Supported Formatting Options</h2>
The documentclass natively supports the following operations:

Text formatting The following text formats are supported:
emphasis, <i>italic</i>, bold, <tt>typewriter</tt>,
^{superscript} and _{subscript}.

Sectioning Sectioning - if needed - can be performed
using the regular <tt>\section</tt>, <tt>\subsection</tt>, <tt>\subsubsection</tt>
and <tt>\paragraph</tt> commands. These will be converted to HTML
header tags and therefore not show section numbers in the final HTML.

Citations and Bibliography You can cite references using
the regular <tt>\cite</tt> command. For example, here is some text
citing a textbook \cite{NielsenChuang2000}, a journal article \cite{Preskill2018},
a newer preprint \cite{SchwarzhansLockErkerFriisHuber2020} and a
journal article whose preprint has an arXiv identifier in old format \cite{AcinBrussL
   Please see quantumview-template.bib for an example of how to provide
bibliographic information to BibLaTeX in a way that yields a suitable
bibliography with DOI links. In both Quantum and Quantum Views all
citations to cited works that have a DOI must include a hyperlink

---

to the DOI of the work.

Formulas You are free to use inline math $\mathcal{Z} - \pi = \nabla\Gamma$
and both the <tt>equation</tt>
\begin{equation}

    \int_0^1 \mathrm{d}x \, |\psi(x)\rangle \! \langle \psi(x)|= \hat{O}^2

\end{equation}
and <tt>align</tt> environment
\begin{align}

    \oint_C = \mathcal{Z}^2.

\end{align}
As formulas are directly rendered on the webpage, you can not
use custom commands and libraries. If you are unsure wether
or not the command you want to use is supported, please consult the
MathJax documentation. You should thus refrain from using the <tt>\label</tt>
and <tt>\ref</tt> commands.

Lists You are free to use both <tt>itemize</tt> for unordered
lists,

    Item 1 lorem ipsum
    Item 2

    and <tt>enumerate</tt> for ordered lists:

    Item 1
    Item 2

    Note that further modifiers, e.g. for roman numbering
and additional packages like <tt>enumerate</tt> are not supported.
<h2>Copy-Editing Tools</h2>
The quantumview document class also provides commands that are useful
in copy-editing. These are <tt>\corr</tt> for ~~correctons~~corrections
and <tt>\ins</tt> for insertions.
